

Optimal bound on the quantum Fisher information

Based on few initial expectation values

Outline

- 1 Introduction and Motivation
- 2 QFI based on expectation values: Are they optimal?
 - Optimisation problem
- 3 Case study
 - Fidelities
 - Spin-squeezed states
 - Unpolarised Dicke states
- 4 Conclusion and outlook

- ① **Many inequalities** have been proposed to lower bound the quantum Fisher Information.

Bounds for qFI

$$F_Q[\varrho, J_z] \geq \frac{\langle J_x \rangle^2}{(\Delta J_y)^2}, \quad F_Q[\varrho, J_y] \geq \beta^{-2} \frac{\langle J_x^2 + J_z^2 \rangle}{(\Delta J_z)^2 + \frac{1}{4}},$$

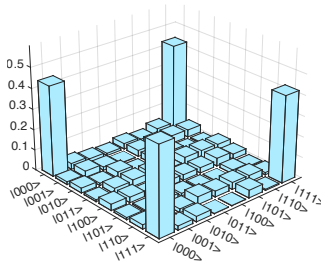

$$F_Q[\varrho, J_z] \geq \frac{4(\langle J_x^2 + J_y^2 \rangle)^2}{2\sqrt{(\Delta J_x^2)^2 (\Delta J_y^2)^2 + \langle J_x^2 \rangle - 2\langle J_y^2 \rangle(1 + \langle J_x^2 \rangle) + 6\langle J_y J_x^2 J_y \rangle}}$$

[L. Pezzé & A. Smerzi, PRL **102**, 100401 (2009)]

[Z. Zhang & L.-M. Duan, NJP **16**, 103037 (2014)]

[I.A., B. Lücke, J. Peise, C. Klempt & G. Toth, NJP **17**, 083027 (2015)]

- 1 **Many inequalities** have been proposed to lower bound the quantum Fisher Information.
- 2 For large systems, we only have *a couple of expectation values* to characterise the state.

- 1 **Many inequalities** have been proposed to lower bound the quantum Fisher Information.

- 1 *Many inequalities* have been proposed to lower bound the quantum Fisher Information.
- 2 For large systems, we only have *a couple of expectation values* to characterise the state.
- 3 The archetypical criteria that shows *metrologically useful entanglement*.

$$F_Q[\varrho, J_z] \geq \frac{\langle J_x \rangle}{(\Delta J_z)^2}$$

[L. Pezzé & A. Smerzi, PRL **102**, 100401 (2009)]

- ① *Many inequalities* have been proposed to lower bound the quantum Fisher Information.
- ② For large systems, we only have *a couple of expectation values* to characterise the state.
- ③ The archetypical criteria that shows *metrologically useful entanglement*.
- ④ It is essential either to *verify them or find new ones* for different set of expectation values.

- 1 Introduction and Motivation
- 2 QFI based on expectation values: Are they optimal?
 - Optimisation problem
- 3 Case study
 - Fidelities
 - Spin-squeezed states
 - Unpolarised Dicke states
- 4 Conclusion and outlook

The non-trivial exercise of computing the qFI

- Different forms of the qFI

$$F_Q[\varrho, J_z] = 2 \sum_{\lambda, \gamma} \frac{(p_\lambda - p_\gamma)^2}{p_\lambda + p_\gamma} |\langle \lambda | J_z | \gamma \rangle|^2$$

Alternatively, as convex roof

$$F_Q[\varrho, J_z] = \min_{\{p_k, |\Psi_k\rangle\}} 4 \sum_k p_k (\Delta J_z)_{|\Psi_k\rangle}^2$$

[M.G.A. Paris, Int. J. Quant. Inf. **7**, 125 (2009)]

[G. Tóth & D. Petz, PRA **87**, 032324 (2013)]

[S. Yu, arXiv:1302.5311]

The non-trivial exercise of computing the qFI

- Different forms of the qFI

$$F_Q[\varrho, J_z] = 2 \sum_{\lambda, \gamma} \frac{(p_\lambda - p_\gamma)^2}{p_\lambda + p_\gamma} |\langle \lambda | J_z | \gamma \rangle|^2$$

Alternatively, as convex roof

$$F_Q[\varrho, J_z] = \min_{\{p_k, |\Psi_k\rangle\}} 4 \sum_k p_k (\Delta J_z)_{|\Psi_k\rangle}^2$$

[M.G.A. Paris, Int. J. Quant. Inf. **7**, 125 (2009)]

[G. Tóth & D. Petz, PRA **87**, 032324 (2013)]

[S. Yu, arXiv:1302.5311]

- For pure states it's extremely simple

$$F_Q[\varrho, J_z] = 4 (\Delta J_z)^2$$

Optimisation based on the Legendre Transform

- When $g(\varrho)$ is a *convex roof*

$$g(\varrho) \geq \mathcal{B}(w := \text{Tr}[\varrho W]) = \sup_r (rw - \sup_{|\psi\rangle} [r\langle W \rangle - g(|\psi\rangle)]).$$

[O. Gühne, M. Reimpell & R.F. Werner, PRL **98**, 110502 (2007)]

[J. Eisert, F.G.S.L. Brandão & K.M.R. Audenaert, NJP **9**, 46 (2007)]

Optimisation for the qFI

The *simplicity* of qFI for pure states leads to

$$\mathcal{F}(w) = \sup_r (rw - \sup_{\mu} [\lambda_{\max}(rW - 4(J_z - \mu)^2)]).$$

For more parameters

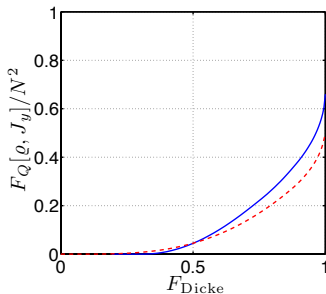

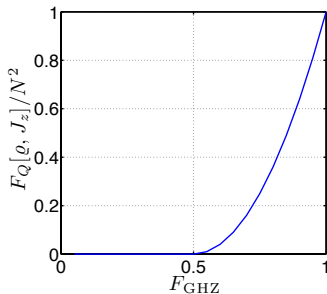

$$\mathcal{F}(\mathbf{w}) = \sup_{\mathbf{r}} (\mathbf{r} \cdot \mathbf{w} - \sup_{\mu} [\lambda_{\max}(\mathbf{r} \cdot \mathbf{W} - 4(J_z - \mu)^2)]).$$

[I.A., M. Kleinmann, O. Ghne & G. Tth, arXiv:1511.05203]

- Measuring F_{GHZ} and F_{Dicke}

- Measuring F_{GHZ} and F_{Dicke}

- Measuring F_{GHZ} and F_{Dicke}

- For fidelity of GHZ \implies *analytic solution*

$$\mathcal{F} = \Theta(F_{\text{GHZ}} - 0.5)(2F_{\text{GHZ}} - 1)^2 N^2$$

Measuring $\langle J_z \rangle$ and $(\Delta J_x)^2$ for Spin Squeezed States

- 1 3 operators $\{J_z, J_x, J_x^2\}$

Measuring $\langle J_z \rangle$ and $(\Delta J_x)^2$ for Spin Squeezed States

- 1 3 operators $\{J_z, J_x, J_x^2\}$
- 2 Projecting \mathcal{F} onto $\langle J_x \rangle$ direction

$$\mathcal{F} \geq \mathcal{F}(\langle J_x \rangle = 0)$$

\Downarrow

$$\mathcal{F}(\langle J_z \rangle, (\Delta J_x)^2) := \mathcal{F}(\langle J_z \rangle, \langle J_x^2 \rangle)$$

Measuring $\langle J_z \rangle$ and $(\Delta J_x)^2$ for Spin Squeezed States

- 1 3 operators $\{J_z, J_x, J_x^2\}$
- 2 Projecting \mathcal{F} onto $\langle J_x \rangle$ direction

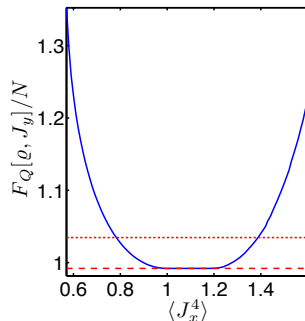

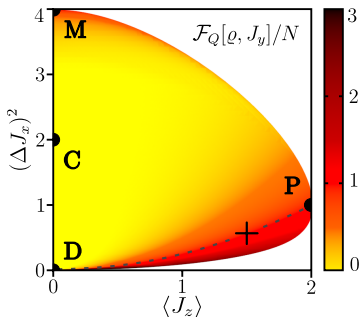

$$\mathcal{F} \geq \mathcal{F}(\langle J_x \rangle = 0)$$

$$\Downarrow$$

$$\mathcal{F}(\langle J_z \rangle, (\Delta J_x)^2) := \mathcal{F}(\langle J_z \rangle, \langle J_x^2 \rangle)$$

- 3 Pezze-Smerzi bound, $F_Q \geq \langle J_z \rangle^2 / (\Delta J_x)^2$, can be verified.

- 4-particle system

Extreme similarity with respect to P-S bound $F_Q \geq \langle J_z \rangle^2 / (\Delta J_x)^2$.

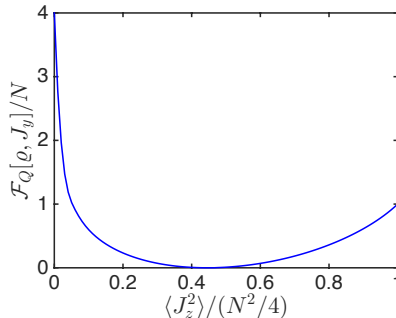

[I.A., M. Kleinmann, O. Güne & G. Tóth, arXiv:1511.05203]

Metrology with unpolarised Dicke states

- 1 3 operators $\{J_x^2, J_y^2, J_z^2\}$; Constraint $\Rightarrow \langle J_x^2 \rangle = \langle J_y^2 \rangle$.

Metrology with unpolarised Dicke states

- 1 3 operators $\{J_x^2, J_y^2, J_z^2\}$; Constraint $\Rightarrow \langle J_x^2 \rangle = \langle J_y^2 \rangle$.
- 2 For $\sum_I \langle J_I^2 \rangle = \frac{N}{2}(\frac{N}{2} + 1)$ and 6 particles:

Realistic characterisation of Dicke state

Experiment \rightarrow [B. Lücke *et al.*, PRL **112**, 155304 (2014)]

Experimental details of unpolarized Dicke state with BEC

$$N = 7900 \quad \langle J_z^2 \rangle = 112 \pm 31$$
$$\langle J_x^2 \rangle = \langle J_y^2 \rangle = 6 \times 10^6 \pm 0.6 \times 10^6$$

- For that large system we use *extrapolation methods*.

Extrapolation:

- 1 Map proportionally expectation values and the unknown bound to *symmetric subspace*.

$$\langle J_z^2 \rangle_{\text{sym}, N} = 145.69 \quad \langle J_x^2 \rangle_{\text{sym}, N} = 7.8 \times 10^6$$

Extrapolation:

- 1 Map proportionally expectation values and the unknown bound to *symmetric subspace*.

$$\langle J_z^2 \rangle_{\text{sym}, N} = 145.69 \quad \langle J_x^2 \rangle_{\text{sym}, N} = 7.8 \times 10^6$$

- 2 Reduce the particle number while keeping $\langle J_z^2 \rangle_{\text{sym}, N}$ constant

$$2\langle J_x^2 \rangle_{\text{sym}, N'} = \frac{N'}{2} \left(\frac{N'}{2} + 1 \right) - \langle J_z^2 \rangle_{\text{sym}, N}.$$

Extrapolation:

- 1 Map proportionally expectation values and the unknown bound to *symmetric subspace*.

$$\langle J_z^2 \rangle_{\text{sym}, N} = 145.69 \quad \langle J_x^2 \rangle_{\text{sym}, N} = 7.8 \times 10^6$$

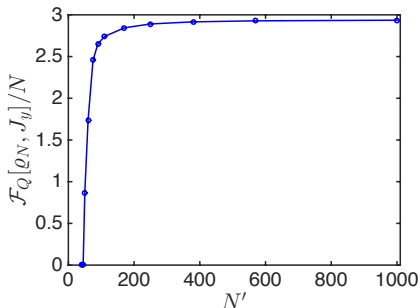

- 2 Reduce the particle number while keeping $\langle J_z^2 \rangle_{\text{sym}, N}$ constant

$$2\langle J_x^2 \rangle_{\text{sym}, N'} = \frac{N'}{2} \left(\frac{N'}{2} + 1 \right) - \langle J_z^2 \rangle_{\text{sym}, N}.$$

- 3 The extrapolation is directly obtained by

$$\frac{\mathcal{F}}{\sum_i \langle J_i^2 \rangle} \gtrsim \frac{\mathcal{F}_{\text{sym}, N}}{N^2/4} \approx \frac{\mathcal{F}_{\text{sym}, N'}}{N'^2/4}.$$

- Obtaining a numerical lower bound this *large system*.

The extrapolated lower bound *converges quickly*.

[I.A., M. Kleinmann, O. Güne & G. Tóth, arXiv:1511.05203]

Conclusion and Outlook

- 1 We proof that for realistic cases *the optimisation is feasible*.

Conclusion and Outlook

- ① We proof that for realistic cases *the optimisation is feasible*.
- ② We used *our approach to verify* the tight bounding of P-S inequality.

Conclusion and Outlook

- ① We proof that for realistic cases *the optimisation is feasible*.
- ② We used *our approach to verify* the tight bounding of P-S inequality.
- ③ We have shown that the lower bounds can be *improved with few extra considerations*.

Conclusion and Outlook

- ① We proof that for realistic cases *the optimisation is feasible*.
- ② We used *our approach to verify* the tight bounding of P-S inequality.
- ③ We have shown that the lower bounds can be *improved with few extra considerations*.
- ④ For large systems the *optimisation method can be complemented* with scaling considerations.

Conclusion and Outlook

- ① We proof that for realistic cases *the optimisation is feasible*.
- ② We used *our approach to verify* the tight bounding of P-S inequality.
- ③ We have shown that the lower bounds can be *improved with few extra considerations*.
- ④ For large systems the *optimisation method can be complemented* with scaling considerations.
- ⑤ The *method is constructed to be universal* and it could be used in many other situations.

Thank you for your attention!
