Optimal bound on the quantum Fisher Information

Based on few initial expectation values of the prove state.

Introduction and Motivation
QFI based on expectation values
Case study
Conclusion and outlook

1. *Many* **inequalities** have been proposed to lower bound the quantum Fisher Information.

Bounds for qFI

$$\mathcal{F}[\varrho, J_z] \geq \frac{\langle J_x \rangle^2}{\left(\Delta J_y\right)^2}, \qquad \mathcal{F}[\varrho, J_y] \geq \beta^{-2} \frac{\langle J_x^2 + J_z^2 \rangle}{\left(\Delta J_z\right)^2 + \frac{1}{4}},$$
$$\mathcal{F}[\varrho, J_z] \geq \frac{4(\langle J_x^2 + J_y^2 \rangle)^2}{2\sqrt{\left(\Delta J_x^2\right)^2 \left(\Delta J_y^2\right)^2} + \langle J_x^2 \rangle - 2\langle J_y^2 \rangle(1 + \langle J_x^2 \rangle) + 6}$$

Optimization problem

The non-trivial exercise of computing the qFI

1. Different forms of the qFI

$$\mathcal{F}[\varrho, J_z] = 2 \sum_{\lambda, \gamma} \frac{(p_\lambda - p_\gamma)^2}{p_\lambda + p_\gamma} |\langle \lambda | J_z | \gamma \rangle|^2$$

$$\mathcal{F}[\varrho, J_z] = \min_{\{p_k, |\Psi_k\rangle\}} 4 \sum_k p_k \left(\Delta J_z\right)^2_{|\Psi_k\rangle}$$

Optimization problem

The non-trivial exercise of computing the qFI

① Different forms of the qFI

$$\mathcal{F}[\varrho, J_z] = 2 \sum_{\lambda, \gamma} \frac{(p_\lambda - p_\gamma)^2}{p_\lambda + p_\gamma} |\langle \lambda | J_z | \gamma \rangle|^2$$

$$\mathcal{F}[\varrho, J_z] = \min_{\{p_k, |\Psi_k\rangle\}} 4 \sum_k p_k \left(\Delta J_z\right)^2_{|\Psi_k\rangle}$$

② For pure states it's extremely simple

$$\mathcal{F}[\varrho, J_z] = 4 \left(\Delta J_z\right)^2$$

③ In the general case, usually *lower bounded* by its *"classical"* counterparts.

Optimization problem

Optimization: Legendre Transform

- For a convex function of the state, we construct a *thight lower bound* as follows,

$$g(\varrho) \geq \mathcal{B}(\{w_k := \langle W_k \rangle\}) = \sup_{\{r_k\}} (r \cdot w - \sup_{\varrho}[r \cdot \langle W \rangle - g(\varrho)]).$$

- When $g(\varrho)$ is deffined as infimum over the convex roof, the 2nd optimization simplified to pure states only,

$$\mathcal{B}(\{w_k\}) = \sup_{\{r_k\}} (r \cdot w - \sup_{|\psi\rangle}[r \cdot \langle W \rangle - g(|\psi\rangle)]).$$

[O. Gühne, M. Reimpell, and R.F. Werner, Phys. Rev. Lett. **98**, 110502 (2007)]

Conclusion and outlook

Optimization problem

Optimization for the qFI

Different because of *simplicity of the qFI for pure states*.

$$\mathcal{F}(\{w_k\}) = \sup_{\{r_k\}} \left(r \cdot w - \sup_{\mu} [\lambda_{\max}(r \cdot W - 4(J_z - \mu)^2)] \right).$$

- Therefore, we have parametrised the optimization, which leads to a *more efficient finding* of the solution.

Spin squeezed states
Unpolarized Dicke states

Introduction and Motivation
QFI based on expectation values
Case study
Conclusion and outlook

Spin squeezed states
Unpolarized Dicke states

- We'll present 2 main cases, spin-squeezed states and unpolarized Dicke.
- Though, we apply our method to projectors with great success, we will focus on global $J_\mathbf{n}$ momentums.
- One of the cases using projector operators, *i.e.*, using the *fidelity* leads to *analytic soulution*!

Spin squeezed states
Unpolarized Dicke states
Measuring $\langle J_z \rangle$ and $(\Delta J_x)^2$ for Spin Squeezed States

1. We use the following 3 operators $\{J_z, J_x, J_x^2\}$ to characterize the input state with their respective expectation values.

2. In the direction of $\langle J_x \rangle$ the worst case is it take the value zero

3. Therefore the optimisation can be done only for 2 operators $\{J_z, J_x^2\}$ and it can be mapep directly to $\langle J_z \rangle, (\Delta J_x)^2$.
